ConvergIA Site Recovery

ConvergIA Professional Services

Disasters come in many forms, but generally fall into three main event categories: operational failure (including power failures, IT hardware failures), natural disasters (like floods or fires), and human-caused events (including malicious activities). These disasters can cripple an organization, regardless of the organization's size—which means that small to midsize businesses are just as much at risk as large multi-national corporations. The Azure Backup service will keep your organization's data safe and recoverable, and Site Recovery replicates, fails over and recovers workloads so that they can remain available to your organization when a failure occurs.

Test Your Disaster Recovery Options

Azure Site Recovery offers your organization the opportunity to test your disaster recovery plans whenever you want, and running these disaster recovery drills will not have an impact on your primary systems. Office 365 100% backed by Microsoft—Peace of Mind.

Orchestrated Disaster Recovery

Azure Site Recovery can automate the recovery of services when a site outage happens at the primary datacenter. Your organization can bring over applications in an orchestrated way to help restore your services quickly, even if you have complex multi-tier workloads.

Data Is Always Being Backed Up Through Continuous Replication

Azure Site Recovery will provide your organization with replication frequency as low as 30 seconds for Hyper-V, and continuous replication for VMware. That means that your data is being backed up every 30 seconds or less.

Why ConvergIA Professional Services

- Comprehensive, and robust solution that can be customized to meet your unique needs.
- Replication and disaster recovery to Microsoft Azure.
- With continuous site replication in place, ConvergIA can take in charge monitoring and remediation, acting as as your IT dept.
- Customized recovery plan
