Extended Security Updates after end of support

for Windows Server 2008 and 2008 R2

Windows
Server

Secure now; upgrade and transform when ready

End of support for Windows Server 2008 and 2008 R2 is January 14, 2020

If you're running Windows Server 2008 or 2008 R2, these versions are reaching the end of their support lifecycle. Each version is backed by a minimum of 10 years of support (5 years for Mainstream Support and 5 years for Extended Support) including regular security updates. End of support means the end of security updates, which can cause security and compliance issues and put applications and business at risk. We recommend upgrading to current versions for the most advanced security, performance, and innovation. For customers that can't get it all upgraded by the deadline, new options help protect applications and data during the upgrade transition.

Migrate your Workloads to Azure

Running current versions of software enables you to benefit from the latest security, performance, and innovation features, as well as regular security updates.

If you cannot upgrade to the latest version before the deadline, however, rehost workloads in Azure and get three years of Extended Security Updates at no additional charge. Gain these benefits:

- More time to modernize on your terms.
- Security built into Azure, plus more than 70 compliance certifications

Use your existing SQL Server licenses to save on Azure Virtual Machines and Azure SQL Database Managed Instance with the Azure Hybrid Benefit.
